

Challenges encountered during the project of email notification features are:

1. Firstly i was confused in which language I need to do this assigned task

Solution: Then after some research and reading the documentations I got to know that I need to start with asp.net to do the backend part of the code which will play the major role in achieving the requirements and then frontend ui can be done in angular.

2. After getting some information about the project I was not getting out the way how to manage controllers, models in .net

Solution: Then on certain amount of research and seeing youtube videos I got to know a little about the code and how to handle controllers to send emails notifications.

3. After completing the backend and frontend part in both .net and angular I was not getting the idea how to integrate both the codes properly to run simultaneously together to send dynamic emails automatically

Solution: Then on taking help of stackoverflow and some ai I got to know how to how to integrate both frontend and backend.

Overall it was interesting and challenging project for me I enjoyed doing it and learned something new and need some more guidance from our mentors in the coming courses.

Thankyou!
